

## BEETLE ATTACK

## DEPLOY BEETLE REPELLENT

■ high beetle threat   ■ moderate beetle threat   ■ low beetle threat

### Verbenone Works!

Verbenone is a replica of what Pine Beetles use to communicate to each other that the tree is full of beetles (No Vacancy). This is a survival technique to prevent too many beetles from attacking the tree and running out of food for the larvae under the bark.

### Application Technique is Critical

This product has only been available to professionals until now.

### Wherever the wind blows, Verbenone sends its message

A thicker stand of trees will keep Verbenone from being blown away and provide constant presence. When Verbenone is applied to sparse areas wind currents should be taken into consideration to provide blanket coverage.

### Application Scenarios

- 1) Single tree & backyard
- 2) Grouped lots & community associations
- 3) Lake lot
- 4) River lot
- 5) Low lying lot
- 6) Gulley, or draw lot
- 7) Acreage
- 8) Island clusters

These application techniques are given to provide you with cost saving results. It is recommended that based on this value system you decide your own appropriate defense, based on your budget.

For more defense example maps in high resolution and to view instruction videos online go to: [www.pine-bug.com](http://www.pine-bug.com)

**No Returns:** Once Verbenone is opened from its aluminum pouch it is activated.

### Hang the Pouches on the North Side

If direct sunlight hits the pouches it will decrease the efficacy of Verbenone as it breaks it down and affects the release rate.

### Instructions for Use

Individual tree placement: one-two pouches/tree on the north face of the tree at 2-3 m height, staple tree at the top flap. Do not puncture the centre of the pouch. Forested areas grid placement is one-two pouches at 10-15 m centres on the north face of the tree at 2-3 m height.

KEEP OUT OF REACH OF CHILDREN AND PETS

**Remember if it's not attacked you can defend!**

### Consultants Available

If you would like assistance, we have local consultants in your area that will:

- a) help identify attacked trees
- b) tell which trees need to be removed
- c) explain your best defense options
- d) set up a best defense based on your budget
