

# CM FlexLure (1x)

*for monitoring Codling Moth*

The **CM FlexLure** has been specifically designed to monitor codling moth (*Cydia pomonella*).

The **CM FlexLure** offers:

- ▶ more reliable catch information than conventional 1X rubber septa lures
- ▶ improved stability of pheromone components
- ▶ longer lure life in the field
- ▶ improved monitoring at a lower price

The **CM FlexLure** is only available from Phero Tech Inc.

The **CM FlexLure** can be used in all trap designs recommended for monitoring codling moth.

## The CM FlexLure

Phero Tech's CM FlexLure is a "composite" lure with superior release properties. Pheromone "blow off", characteristic of conventional lures, has been eliminated. Stabilizers have been added to improve pheromone integrity. The CM FlexLure will last 60 days so a complete adult flight can be monitored accurately, without lure changes.

## The Right Lure is Important

Trapping systems consist of a lure and a disposable or reusable trap. A critical requirement is for the lure to release pheromone at a relatively constant rate. Should it be too low, the apparent trap catch shutdown will not be due to mating disruption. Growers would falsely conclude that mating disruption is working and not take corrective control actions. Significant and unexpected crop damage could occur. Conversely, if lure release rates are too high, resulting high trap catches would erroneously indicate poor mating disruption control. Growers might engage in expensive, unnecessary control action.

Conventional "monolithic" rubber septa lures initially release pheromone at very high rates, then rapidly deplete to rates below desired action thresholds. Catch data from newly installed lures is not comparable to data from lures field aged for as little as one week. This can be countered somewhat by frequent and costly lure changes, at a time when time is scarce.
