SuperBoost Revolution in Pollination

Our revolutionary new product **SuperBoost** (Patents Pending) developed in collaboration between Pherotech and Texas A&M University is the ultimate solution to improve the health and vigor of Beehives as well as improve crop pollination.

SuperBoost is a 10-component brood pheromone device that is easily hung between the frames of beehives. The wafer release device allows workers to surround the slow release pheromone membrane and contact minute amounts of the brood pheromone. Scientific studies have shown excellent results. One device placed in the beehive works for over 30 days. [data are available upon request]

Benefits for Beekeepers:

- Increases the pollen load each foraging worker brings back to the hive by up to 100%.
- Increases the colony growth rate in the summer and winter.
- Lowers the age of first foraging by worker honey bees.
- Increases the overall health of the hive.
- Increases the number of young worker bees.
- Increases queen feeding and egg laying rate.
- Increases honey production.
- Inhibits swarming.
- Stimulates feeding on pollen patties and antibiotic supplements by over-wintering honey bees.

Benefits for Growers:

- Increases pollen foraging on the target crop by 43%.
- Increases pollination activity of non-pollen foragers on the target crop by 54%.
- Increases the number of pollen foraging trips per unit time by up to 72%.

Benefits for Both:

- Increases the number of pollen foragers by up to 150%.
- Increases the number of nectar foragers by up to 150%.

We are now taking pre-orders for this most anticipated product in decades!
